TAILORED FOR FULLSTACK

Esteban Garzon

Backend Software Engineer | APIs, Concurrency, Production Systems, and AI-Assisted Delivery

Quito, Ecuador | Remote for U.S. teams | English and Spanish | Engineer with a four-year degree focused on backend workflows, operational software, data infrastructure, and reliable systems execution

PORTFOLIO AND ENGINEERING SAMPLES

estebangarzon.com

Public source bundles, backend integration work, concurrency-oriented sync samples, internal tools, and operational software projects live here. It is the best link to review before evaluating technical fit.

PROFESSIONAL SUMMARY

Backend-oriented software engineer with hands-on experience building production workflows, API integrations, data services, and internal platforms that support real business operations. My recent work has involved resilient ETL pipelines, multiprocessing sync infrastructure, REST integrations, background jobs, structured logging, database-centered design, and automation systems deployed for U.S.-based teams. I am strongest when I can take ownership of a messy technical problem, translate it into a reliable service or workflow, and keep iterating until the system is stable, useful, and maintainable. For deeper engineering context and public technical samples, please visit **estebangarzon.com**.

Backend APIs And Services

Experience designing integration-heavy backend workflows, authentication-aware API connections, scheduled jobs, and data services that support business-critical operations.

Concurrency And Reliability

Built multiprocessing sync patterns, queue-based processing, defensive deduplication, structured logging, and monitoring-oriented workflows for long-running jobs.

Large Systems Mindset

Comfortable reasoning about messy source systems, database schemas, data freshness, background processing, and how components behave together in production.

Execution Style

High ownership, detail-oriented, and used to working independently with U.S.-based teams while documenting decisions and shipping practical technical solutions.

RELEVANT EXPERIENCE

Data Engineer | Backend Integrations, Sync Infrastructure, and Production Workflows

2024 - PRESENT

Remote from Ecuador for a U.S.-based client (Ecuassist) | Engineering work across backend pipelines, APIs, concurrency patterns, databases, and internal systems

- Built production backend workflows in Python that connect SQL Server, PostgreSQL, Microsoft Graph, RFMS, Moraware, Samsara, spreadsheets, and other operational systems into reliable services and data flows.
- Designed multiprocessing sync jobs and queue-based processing patterns to move high-volume operational data more efficiently while keeping inserts, progress tracking, and error handling under control.
- Implemented API integrations, auth-aware data extraction, structured transformations, and backend logic that turned noisy operational inputs into consistent, queryable outputs.
- Created background jobs, scheduled tasks, validation checks, and defensive deduplication logic to make long-running processes more stable and production-ready.
- Built internal tooling and workflow layers that reduced manual coordination, improved visibility, and gave teams better operational feedback loops.
- Worked closely with stakeholders to define requirements, troubleshoot system issues, and ship technical solutions that matched business constraints instead of idealized assumptions.
- Documented implementation details, assumptions, and operational behavior in English so systems could be maintained and extended by distributed teams.

Data Scientist, Analyst, and Technical Project Roles

2022 - 2023

Gringconstruc and Universidad San Francisco de Quito | Technical analysis, modeling, and decision-support work for infrastructure and energy projects

- Built analytical models and structured technical outputs for hydroelectric, photovoltaic, water-system, and construction initiatives with significant operational complexity.
- Strengthened my discipline around translating ambiguous requirements into structured work products, validating assumptions, and communicating clearly with non-technical stakeholders.
- Developed the execution habits that now carry into software projects: forensic attention to detail, organized delivery, and ownership of outcomes from problem definition through usable output.

SELECTED ENGINEERING EVIDENCE

Concurrency-Heavy Sync Infrastructure

PORTFOLIO

Multiprocessing extraction and queue-driven processing for long-running sync jobs that needed better throughput, visibility, and resilience

---

Backend API And Data Services

PORTFOLIO

Sanitized public integration bundle showing Microsoft Graph, RFMS, Moraware, Samsara, and Excel-ingestion patterns for backend-oriented operational software

---

Operational Software And Internal Tools

PORTFOLIO

Examples of software layers that convert real field activity, job state, and operational signals into clearer execution systems for teams

> More technical depth, public code bundles, and engineering evidence are available at **estebangarzon.com**. That portfolio gives a clearer view of my backend integrations, concurrency-oriented patterns, operational software work, and production-minded implementation style.

TAILORED FOR: GO SOFTWARE ENGINEER TALENT NETWORK ROLE AT FULLSTACK | MARCH 2026

Role Match

Backend APIs · Concurrency mindset · Production workflows · Large systems thinking · CI/CD awareness · Agile-friendly delivery · Ownership mentality · Remote U.S. collaboration

Core Tools

Python · JavaScript · REST APIs · PostgreSQL · SQL Server · Concurrency patterns · Multiprocessing · Background jobs · Structured logging · Monitoring · ETL services · Automation systems · Database design · Documentation

Nice-To-Have Alignment

- AI-assisted workflow
- Codex / CLI tooling
- Internal platforms
- System troubleshooting
- Operational software
- Continuous improvement

Why This Fits

Ownership over complexity

I am used to taking incomplete, difficult operational problems and turning them into working software that behaves reliably under real constraints.

Concurrency-oriented evidence

My public work includes multiprocessing sync patterns and throughput-conscious backend logic, which maps well to Go-style systems thinking even when the implementation language varies.

Detail and delivery discipline

I care about edge cases, maintainability, and outcomes. That mix has been essential in environments where bad data or unstable integrations create expensive operational noise.

Education

Master's in Data Science and Business Intelligence
Universidad de las Americas | 2025 - 2026

Civil Engineering
Universidad San Francisco de Quito | 2018 - 2023

Languages

English: professional working proficiency

Spanish: native

Selected Courses

Foundations of Data Science | Google

Get Started with Python | Google
