TAILORED FOR NEAR

# Esteban Garzon

## Data Architect | Analytics Specialist | Power BI, SQL, and Reporting Systems

Quito, Ecuador | Remote for U.S. teams | English and Spanish | Currently operating at CTO level while remaining hands-on across analytics, reporting, and automation delivery

## PROFESSIONAL SUMMARY

Data architect, analytics specialist, and automation leader with hands-on experience building reporting ecosystems for U.S.-based operations. My recent work centers on Power BI dashboards, SQL-driven reporting, ETL pipelines, analytics-ready data layers, and AI-enabled automations that improve visibility, reduce manual work, and support decision-making across operations, finance, logistics, and production. I am comfortable translating high-level business questions into business-ready dashboards and underlying data logic, working across SQL Server, PostgreSQL, Excel-based operational data, ERP-style systems, vendor APIs, and Microsoft services. For deeper project detail and public code samples, please visit estebangarzon.com.

### Reporting Layer Strength

Power BI dashboarding, joins and filters, KPI design, data shaping, and multi-source reporting for operational and financial workflows.

### Data Platform Breadth

Production work across SQL Server, PostgreSQL, Excel ingestion, APIs, scheduling, incremental loads, auditability, and analytics-ready transformations.

### Microsoft Ecosystem Exposure

Hands-on integration work with Azure AD client credentials and Microsoft Graph, plus experience building BI workflows that fit Microsoft-heavy environments.

### Execution Style

Self-sufficient, fast-moving, and comfortable iterating with stakeholders from high-level requirements through production-ready reporting deliverables.

## RELEVANT EXPERIENCE

### Data Engineer | BI, Automation, and AI Systems Lead

**2024 - Present**

Remote from Ecuador for a U.S.-based client (Ecuassist) | Currently operating at CTO level across data, automation, and reporting systems

- Built and maintained an end-to-end reporting ecosystem using Power BI, SQL, PostgreSQL, and Python to support management visibility across operations, production, logistics, and financial workflows.
- Designed dashboards and reporting layers for machine performance, utilization, downtime, cutting output, labor efficiency, order profitability, gross margin signals, and material yield analysis.
- Developed ETL pipelines that connect SQL Server, Excel-based shop-floor logs, PostgreSQL, RFMS, Moraware, Slabsmith, Samsara, and other operational data sources into analytics-ready structures.
- Worked directly from high-level business needs, clarifying requirements with stakeholders and iterating reporting views until they were clear, interactive, and usable for day-to-day decision-making.
- Implemented incremental load logic, deduplication, batch processing, scheduling, audit tables, and data quality checks to keep reporting timely and reliable without unnecessary full refresh churn.
- Built Microsoft Graph integrations using Azure AD client credentials and designed adjacent Microsoft-oriented automations, giving me practical familiarity with Microsoft-centric data environments.
- Produced English-language documentation, technical walkthroughs, and operational support material for distributed teams using the reporting and automation stack.

### Role Match

Power BI dashboards | SQL reporting | Data modeling mindset | Cross-source ETL | Operational analytics | Financial reporting context

### Core Tools

Power BI | SQL | PostgreSQL | SQL Server | Python | pandas | SQLAlchemy | REST APIs | Microsoft Graph | Azure AD | n8n | Zapier | scikit-learn | XGBoost

### Why This Fits Near

**Reporting-first delivery**

My strongest recent work sits at the reporting layer: shaping data, defining metrics, and building dashboards that leadership teams can use daily.

**Fast iteration with stakeholders**

I am used to receiving high-level requirements, refining them quickly, and producing decision-ready outputs without waiting for perfectly specified briefs.

**Transferable cloud warehouse readiness**

While my portfolio showcases SQL Server and PostgreSQL most directly, the underlying work is highly relevant to Azure warehouse reporting patterns and semantic-layer thinking.

## Selected Experience, Portfolio Signals, and Education

### ADDITIONAL EXPERIENCE

### Data Scientist, Data Analyst, and Financial Modeling Roles

**2022 - 2023**

Gringconstruc and Universidad San Francisco de Quito | Energy, construction, and public infrastructure projects

- Built analytical models for hydroelectric, photovoltaic, construction, and water-system projects, translating raw technical data into decision support for investment and operations.
- Performed forecasting, scenario analysis, feasibility studies, and business modeling tied to projected production, revenue, and long-term sustainability.
- Communicated analytical findings in a business context, strengthening my ability to bridge technical work with stakeholder priorities and executive-facing reporting.

### SELECTED PORTFOLIO EVIDENCE

**Slab ETL Nexus**

Production ETL combining SQL Server, Excel logs, and PostgreSQL into a trustworthy reporting layer for operations.

**Moraware Sync Engine**

Multi-source synchronization workflows that restructure fabrication, CAD, installation, and vendor activity into cleaner analytical records.

**Live Data Integration Lab**

Public source bundle with sanitized Microsoft Graph, RFMS, Samsara, and spreadsheet-ingestion samples that demonstrates practical ETL and integration patterns.

**Portfolio CTA**

More project depth, code samples, and sanitized engineering bundles are available at estebangarzon.com. If you want to assess fit beyond this CV, that portfolio gives the clearest picture of how I build reporting layers, ETL pipelines, and operational analytics systems.
